Clinical and medical interventions for suicidal crisis must include discussions of access to firearms and safe storage. This training will address the problem of suicide, the integration of firearm and means safety into clinical practice, and the cultural challenges of conversations about guns with clients and patients. Participants will practice difficult discussions to improve clinical readiness regarding discussions of gun safety and safe storage in the context of a public health approach to suicide prevention.

At the end of this workshop, the learner will be able to:

1. Describe the theoretical and scientific underpinnings of means safety as a method of suicide prevention.
2. Practice and demonstrate directive and collaborative approaches to discussions of means safety and gun ownership.
3. Apply cultural information of gun owners to clinical interventions regarding safe storage of firearms for clients at risk of suicide.
